CryPing is a simple command-line utility designed to find out if an FTP, HTTP, SMTP, PPP or PORT command is in fact successful. You can try it from your own Command-Line or PowerShell prompt. How can I run a program from the command line using Java? I'm trying to run my program from the command line using Java, without the need for a GUI. I have a.bat file that includes my program's name (for example, "app.bat"), and I want to be able to run this program from the command line. Here's my current code (in.java): Process p = Runtime.getRuntime().exec("app.bat"); InputStream in = p.getInputStream(); InputStream err = p.getErrorStream(); String line = ""; while ((line = in.readLine())!= null) { System.out.println(line); } System.out.println(err.readLine()); I then want to just tell the program to start from the command line, then have it print out the input that it receives. Thanks! A: There's a library that makes this very simple: Say you have public class SomeClass { public static void main(String[] args) { SomeClass someClass = new SomeClass(); someClass.run(args); } public void run(String[] args) { ... } } then you could run it like this: java -jar myapp.jar -t SomeClass "input args" Obviously you'd have to rework the above example to get your particular class to do something useful. This library also allows you to set command-line options, so you can have the jvm take in the same kind of flags as your other programs: java -jar myapp.jar -j

### CryPing Full Version

Welcome to CryPing CryPing is a simple and small easy-to-use tool for those of you who want to test the connectivity of their computers. Why do people need it? Well for a start many people might use a PC for different functions like Audio Recording, Skype, FTP etc. They can connect to such services via a router but if they are behind a firewall then they cant connect to such services as they normally would. What can it do? This tool has many different features to test the connectivity and what IP server a particular computer is attached to. It will help you to find out if you have a problem with your internet connection, DNS server, Network Card on your PC or if your PC is actually on the same router as the IP services you are trying to access. How does it work? It uses the ping command so basically what happens is if you specify a DNS server and give a computer IP address then it will ping it and work out what IP is it connected to. This is usually the router IP of the IP services such as the FTP that you want to access. Please try it out and let us know if you think it should be added to our site! More often than not, a common issue that you are likely to experience with your network is that it is running too slow. A slow network does not only make the use of certain applications – such as VoIP tools for instance – impossible to use, but you may also get false network failure notifications due to the time it takes to get the packets from the source to the destination. CryPing is a tiny tool that can help you find out whether the network is to blame for the failure or you should be inquiring about other problems on your system. A quick way to test connectivity and ports Even though the program can be run via Command Line or PowerShell, you should know that it provides all the available commands when run, so you can get started from here. The main functionality of the app is to help you test the connection between your computer and another device, that can be a remote computer for which you need to specify the DNS and IP address. In addition to testing the connectivity, the app can also be used for testing individual ports and hence, figure out why you cannot connect to your FTP, POP3 or SMTP services, for example. Moreover, since the idea is to ping IP addresses, you can also employ it to check whether a web
